

# USER INSTRUCTIONS

for high wire hooks without free fall

crop wire

1 Our high-wire hooks without free-falling part do not have any loose ends. The metres of twine are wound completely on the hook. The tomato hooks are neatly arranged in the box.

2 Hang the hooks on the crop wire one by one. The hooks must be unwound manually. Tie the end of the twine to the young plant. The length of the twine on the wound hook is always wound to size for the customer.

3 During cultivation, the plant grows and the hook is unwound further and further. The hook moves further and further along on the crop wire. The total length of the fully grown plant determines the total length of the twine on the high wire hook.
